## High-Side Power and Current Monitors

### General Description

The MAX4210/MAX4211 low-cost, low-power, high-side power/current monitors provide an analog output voltage proportional to the power consumed by a load by multiplying load current and source voltage. The MAX4210/MAX4211 measure load current by using a high-side current-sense amplifier, making them especially useful in battery-powered systems by not interfering with the ground path of the load.

The MAX4210 is a small, simple 6-pin power monitor intended for limited board space applications. The MAX4210A/B/C integrate an internal 25:1 resistor-divider network to reduce component count. The MAX4210D/E/F use an external resistor-divider network for greater design flexibility.

The MAX4211 is a full-featured current and power monitor. The device combines a high-side current-sense amplifier, 1.21V bandgap reference, and two comparators with open-drain outputs to make detector circuits for overpower, overcurrent, and/or overvoltage conditions. The open-drain outputs can be connected to potentials as high as 28V, suitable for driving high-side switches for circuit-breaker applications.

Both the MAX4210/MAX4211 feature three different current-sense amplifier gain options: 16.67V/V, 25.00V/V, and 40.96V/V. The MAX4210 is available in 3mm x 3mm, 6-pin TDFN and 8-pin μMAX® packages and the MAX4211 is available in 4mm x 4mm, 16-pin thin QFN and 16-pin TSSOP packages. Both parts are specified for the -40°C to +85°C extended operating temperature range.

### Applications

- Overpower Circuit Breakers
- Smart Battery Packs/Chargers
- Smart Peripheral Control
- Short-Circuit Protection
- Power-Supply Displays
- Measurement Instrumentation
- Baseband Analog Multipliers
- VGA Circuits
- Power-Level Detectors

μMAX is a registered trademark of Maxim Integrated Products, Inc.

**Pin Configurations and Selector Guide appear at end of data sheet.**

### Features

- ◆ Real-Time Current and Power Monitoring
- ◆ ±1.5% (max) Current-Sense Accuracy
- ◆ ±1.5% (max) Power-Sense Accuracy
- ◆ Two Uncommitted Comparators (MAX4211)
- ◆ 1.21V Reference Output (MAX4211)
- ◆ Three Current/Power Gain Options
- ◆ 100mV/150mV Current-Sense Full-Scale Voltage
- ◆ +4V to +28V Input Source Voltage Range
- ◆ +2.7V to +5.5V Power-Supply Voltage Range
- ◆ Low Supply Current: 380µA (MAX4210)
- ◆ 220kHz Bandwidth
- ◆ Small 6-Pin TDFN and 8-Pin μMAX Packages (MAX4210)

### Ordering Information

PART	TEMP RANGE	PIN-PACKAGE	TOP MARK
MAX4210AETT	-40°C to +85°C	6 TDFN-EP* (3mm x 3mm)	AHF
MAX4210AEUA	-40°C to +85°C	8 μMAX	—

\*EP = Exposed paddle.

**Ordering Information continued at end of data sheet.**

# High-Side Power and Current Monitors

## ABSOLUTE MAXIMUM RATINGS

V<sub>CC</sub>, IN, CIN1, CIN2 to GND ..... -0.3V to +6V  
 RS+, RS-, INHIBIT, LE, COUT1, COUT2 to GND ..... -0.3V to +30V  
 IOUT, POUT, REF to GND ..... -0.3V to (V<sub>CC</sub> + 0.3V)  
 Differential Input Voltage (V<sub>RS+</sub> - V<sub>RS-</sub>) ..... ±5V  
 Maximum Current into Any Pin ..... ±10mA  
 Output Short-Circuit Duration to V<sub>CC</sub> or GND ..... 10s  
 Continuous Power Dissipation (T<sub>A</sub> = +70°C) ..... 6-Pin TDFN (derate 24.4mW/°C above +70°C) ..... 1951mW

8-Pin μMAX (derate 4.5mW/°C above +70°C) ..... 362mW  
 16-Pin TSSOP (derate 9.4mW/°C above +70°C) ..... 754mW  
 16-Pin Thin QFN (derate 25mW/°C above +70°C) ..... 2000mW  
 Operating Temperature Range ..... -40°C to +85°C  
 Junction Temperature ..... +150°C  
 Storage Temperature Range ..... -65°C to +150°C  
 Lead Temperature (soldering, 10s) ..... +300°C

*Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.*

## Functional Diagrams

# High-Side Power and Current Monitors

## Functional Diagrams (continued)

**MAX4210/MAX4211**

### Detailed Description

The MAX4210/MAX4211 families of current- and power-monitoring ICs integrate a precision current-sense amplifier and an analog multiplier for a variety of current and power measurements. The MAX4211 integrates an additional uncommitted 1.21V reference and two comparators with open-drain outputs. These features enable the design of detector circuits for over-power, overcurrent, overvoltage, or any combination of fault conditions. The MAX4210/MAX4211 offer various gains, packages, and configurations allowing for greater design flexibility and lower overall cost.

These devices monitor the load current with their high-side current-sense amplifiers and provide an analog

output voltage proportional to that current at  $I_{OUT}$  (MAX4211). This voltage is fed to the analog multiplier for multiplying the load current with a source voltage to obtain a voltage proportional to load power at  $POUT$ .

#### Current-Sense Amplifier

The integrated current-sense amplifier is a differential amplifier that amplifies the voltage across  $RS_+$  and  $RS_-$ . A sense resistor,  $R_{SENSE}$ , is connected across  $RS_+$  and  $RS_-$ . A voltage drop across  $R_{SENSE}$  is developed when a load current is passed through it. This voltage is amplified and is proportional to the load current. This voltage is also fed to the analog multiplier for power-sensing applications (see the *Analog Multiplier* section). The current-sense amplifiers feature three gain options: 16.67V/V, 25.0V/V, and 40.96V/V (see Table 1).

## High-Side Power and Current Monitors

The common-mode voltage range is +4V to +28V and independent of the supply voltage. With this feature, the device can monitor the output current of a high-voltage source while running at a lower system voltage typically between 2.7V and 5.5V.

The MAX4211 has a current-sense amplifier output. The voltage at IOUT is proportional to the voltage across VSENSE.

$$V_{IOUT} = AV_{IOUT} \times V_{SENSE}$$

where VSENSE is the voltage across RS+ and RS-, and AVIOUT is the amplifier gain of the device given in Table 1.

### Analog Multiplier

The MAX4210/MAX4211 integrate an analog multiplier that enables real-time monitoring of power delivered to a load. The voltage proportional to the load current is fed to one input of the multiplier and a voltage proportional to the source voltage is fed to the other. The analog multiplier multiplies these two voltages to obtain an output voltage proportional to the load power. The analog multiplier is designed only to operate in the positive quadrant, that is, the inputs and outputs are always positive voltages.

For the MAX4210D/E/F and MAX4211D/E/F, the analog multiplier full-scale input at IN is approximately 1V. This independent multiplier input allows greater design flexibility when using an external voltage-divider. For the MAX4210A/B/C and MAX4211A/B/C, an integrated voltage-divider divides the source voltage at the RS+ pin by a nominal value of 25 and passes this voltage to the multiplier. Thus, the full-scale input voltage at RS+ is 25V. The integrated, trimmed resistor-dividers reduce external component count and cost.

The voltage output at POUT is proportional to the output power:

For the MAX4210A/B/C and MAX4211A/B/C:

$$V_{POUT} = AV_{POUT} \times V_{SENSE} \times V_{RS+}$$

For the MAX4210D/E/F and MAX4211D/E/F:

$$V_{POUT} = AV_{POUT} \times V_{SENSE} \times V_{IN}$$

**Table 1. MAX4211 Current-Sense Amplifier Gain and Full-Scale Sense Voltage**

PART	CURRENT-SENSE AMPLIFIER GAIN (AVIOUT, V/V)	FULL-SCALE SENSE VOLTAGE (mV)
MAX4211A/D	16.67	150
MAX4211B/E	25.00	150
MAX4211C/F	40.96	100

where VSENSE is the voltage across RS+ and RS- and AVPOUT is the amplifier gain of the device given in Table 2.

### Internal Comparators (MAX4211)

The MAX4211 features two uncommitted open-drain output comparators. These comparators can be configured to trip when load current or power reaches a set limit. They can also be configured as a window comparator with wire-OR output. Comparator 1 (COUT1) features latch-enable (LE) and inhibit (INHIBIT) inputs. When LE is low, the comparator is transparent (it functions as a regular unlatched comparator). When LE is high, the comparator output (COUT1) is latched. When high, the INHIBIT input suspends the comparator operation and latches the output to the current state. The operation of INHIBIT is similar to LE, except it has a different input threshold and wider hysteresis. The INHIBIT logic-high threshold is 1.21V and logic-low threshold is 0.6V with 0.6V hysteresis. INHIBIT is useful in preventing the comparator from giving false output during fast RS+ transients. INHIBIT is generally triggered by an RC network connected to RS+ (see the *Applications Information*). Both comparators have a built-in 300μs blanking period at power-up to prevent false outputs. The comparator outputs are open drain and they can be pulled up to VCC, RS+, or any voltage less than +28V. LE and INHIBIT are internally pulled down by a 1μA source.

**Table 2. MAX4210/MAX4211 Power-Sense Amplifier Gain and Full-Scale Sense Voltage**

PART	POWER-SENSE AMPLIFIER GAIN (AVPOUT, 1/V)	FULL-SCALE SENSE VOLTAGE (mV)

# High-Side Power and Current Monitors

## Internal Reference (MAX4211)

The MAX4211 features a 1.21V bandgap reference output, stable over supply voltage and temperature. Typically, the reference output is connected to one of

the comparators' inputs. This is the comparison reference voltage. If a lower reference voltage is needed, use an external voltage-divider. The reference can source or sink a load current up to 100 $\mu$ A.

## Typical Operating Circuit

**MAX4210/MAX4211**

# High-Side Power and Current Monitors

## Applications Information

### Recommended Component Values

Ideally, the maximum load current develops the full-scale sense voltage across the current-sense resistor. Choose the gain version needed to yield the maximum current-sense amplifier output voltage without saturating it. The typical high-side saturation voltage is about  $V_{CC} - 0.25V$ . The current-sense amplifier output voltage is given by:

$$V_{IOUT} = V_{SENSE} \times A_{VOUT}$$

where  $V_{IOUT}$  is the voltage fed to the analog multiplier or at  $I_{OUT}$ .  $V_{SENSE}$  is the sense voltage.  $A_{VOUT}$  is the current-sense amplifier gain of the device specified in Table 1. Calculate the maximum value for  $R_{SENSE}$  so the differential voltage across  $RS_+$  and  $RS_-$  does not exceed the full-scale sense voltage:

$$R_{SENSE} = \frac{V_{SENSE(FULL-SCALE)}}{I_{LOAD(FULL-SCALE)}}$$

Choose the highest value resistance possible to maximize  $V_{SENSE}$  and thus minimize total output error. In applications monitoring high current, ensure that  $R_{SENSE}$  is able to dissipate its own  $I^2R$  power dissipation. If the resistor's power dissipation is exceeded, its value can drift or it can fail altogether, causing a differential voltage across the terminals in excess of the absolute maximum ratings. Use resistors specified for current-sensing applications.

### Window Comparator

In some applications where undercurrent or underpower (open-circuit fault) and overcurrent or overpower (short-circuit fault) needs to be monitored, a window comparator is desirable. Figure 1 shows a simple circuit suitable for window detection. Let  $P_{OVER}$  be the minimum load power required to cause a low state at  $COUT_2$ , and let  $P_{UNDER}$  be the maximum load current required to cause a high state at  $COUT_1$ :

$$P_{UNDER(WATTS)} = \frac{V_{REF}}{A_{VPOT} \times R_{SENSE}} \left( \frac{R_1 + R_2}{R_2} \right)$$

$$P_{OVER(WATTS)} = \frac{V_{REF}}{A_{VPOT} \times R_{SENSE}} \left( \frac{R_4 + R_5}{R_5} \right)$$

where  $A_{VPOT}$  is the power-sense amplifier gain given in Table 2, and  $V_{REF}$  is the internal reference voltage (1.2V, typ). The resulting comparator output is high

when the current is inside the current window and low when the current is outside the window. Note that  $COUT_1$  and  $COUT_2$  are wire-ORed together.

### Overpower Circuit Breaker

Figure 2 shows a circuit breaker that shuts off current to the load when an overpower fault is detected (the same circuit can be used to detect overcurrent conditions by connecting the  $R_1-R_2$  resistor-divider to  $I_{OUT}$ , instead of  $POUT$ ). This circuit is useful for protecting the battery from short-circuit or overpower conditions. When a power fault is detected, the P-MOSFET, M1, is turned off and stays off until the manual reset button is pressed. Also, cycling the input power causes the LE pin to go low, which unlatches the comparator output  $OUT_1$  and resets the circuit breaker.

During power-up or when the characteristics of the load change, there can be an inrush current into the load. The temporary inrush current results in a higher voltage at  $POUT$ . This can bring the voltage at  $CIN+$  above the reference voltage at  $CIN-$ , and, as a result,  $COUT_1$  goes high triggering the circuit-breaker function. This unwanted behavior can be disabled by bringing comparator 1's INHIBIT input high. An RC network connected to INHIBIT ( $R_4$  and  $C_1$ ) can be incorporated to suspend comparator 1's operation for a brief period. In this way, short surges in load power can be made invisible to the circuit-breaker function, while longer term overpower load demands (or a load short circuit) still "trip the breaker."

The logic-high threshold for INHIBIT is typically 1.2V, and the logic-low threshold is 0.6V. During power-up, INHIBIT quickly exceeds 1.2V through  $C_1$  and inhibits  $COUT_1$  from changing state. The comparator inputs are "inhibited" until the INHIBIT voltage is discharged to 0.6V.  $R_3$  is a current-limiting resistor, typically  $10k\Omega$ , which protects the INHIBIT input. Since INHIBIT is a high-impedance input,  $R_3$  has no effect on the  $R_4-C_4$  charge/discharge time. The time during which the comparator is suspended is approximated by:

$$t_{INHIBIT} = R_4 \times C_1 \ln \left( \frac{\Delta V}{0.6V} \right)$$

where  $\Delta V$  is the voltage change at the load. For improved transient immunity,  $t_{INHIBIT}$  can be increased as required, with the understanding that the breaker function will be suspended for this period.

If any comparator is not used, its input must be biased to a known state. For example, connect  $CIN+$  to  $V_{CC}$  and  $CIN-$  to GND.

# High-Side Power and Current Monitors

**MAX4210/MAX4211**

Figure 1. Window Comparator for Detecting Underpower and Overpower Faults (Also Detects Underrun and Overcurrent Faults by R1 and R4 to IOUT Instead of POUT)

### Variable-Gain Amplifier

Figure 3 shows single-ended input, variable-gain amplifiers (VGA). This VGA features more than 200kHz bandwidth and is useful in automatic gain-control circuits commonly found in baseband processors. The gain is controlled by applying 0 to 1V to IN (V<sub>GC</sub>) of the MAX4210D/E/F; 0V corresponds to minimum gain and 1V corresponds to maximum gain.

### Measure Load Power

The MAX4210A/B/C and MAX4211A/B/C have internal voltage-divider resistors connected to RS+ and the analog multiplier input. This configuration measures source power accurately and provides protection to the power source such as a battery. To measure the load

power accurately, choose the MAX4210D/E/F and MAX4211D/E/F with an external resistor-divider connected directly to the load as shown in Figure 4. This configuration improves the load-power measurement accuracy by excluding the additional power dissipated by RSENSE.

### Power-Supply Bypassing

Bypass V<sub>CC</sub> to GND with a 0.1μF ceramic capacitor to isolate the IC from supply-voltage transients. To prevent high-frequency coupling, bypass RS+ or RS- with a 0.1μF capacitor. On the TDFN and thin QFN packages, there is an exposed paddle that does not carry any current, but should also be connected to the ground plane for rated power dissipation.

SUNSTAR商斯达实业集团是集研发、生产、工程、销售、代理经销、技术咨询、信息服务等为一体的高科技企业，是专业高科技电子产品生产厂家，是具有 10 多年历史的专业电子元器件供应商，是中国最早和最大的仓储式连锁规模经营大型综合电子零部件代理分销商之一，是一家专业代理和分銷世界各大品牌IC芯片和電子元器件的连锁经营綜合性国际公司。在香港、北京、深圳、上海、西安、成都等全国主要电子市场设有直属分公司和产品展示展销窗口门市部专卖店及代理分销商，已在全国范围内建成强大统一的供货和代理分销网络。我们专业代理经销、开发生产电子元器件、集成电路、传感器、微波光电元器件、工控机/DOC/DOM电子盘、专用电路、单片机开发、MCU/DSP/ARM/FPGA软件硬件、二极管、三极管、模块等，是您可靠的一站式现货配套供应商、方案提供商、部件功能模块开发配套商。**专业以现代信息产业（计算机、通讯及传感器）三大支柱之一的传感器为主营业务，专业经营各类传感器的代理、销售生产、网络信息、科技图书资料及配套产品设计、工程开发。我们的专业网站——中国传感器科技信息网（全球传感器数据库）[www.SENSOR-IC.COM](http://www.SENSOR-IC.COM) 服务于全球高科技生产商及贸易商，为企业科技产品开发提供技术交流平台。欢迎各厂商互通有无、交换信息、交换链接、发布寻求代理信息。欢迎国外高科技传感器、变送器、执行器、自动控制产品厂商介绍产品到 中国，共同开拓市场。**本网站是关于各种传感器-变送器-仪器仪表及工业自动化大型专业网站，深入到工业控制、系统工程计 测计量、自动化、安防报警、消费电子等众多领域，把最新的传感器-变送器-仪器仪表买卖信息，最新技术供求，最新采购商，行业动态，发展方向，最新的技术应用和市场资讯及时的传递给广大科技开发、科学的研究、产品设计人员。本网站已成功为石油、化工、电力、医药、生物、航空、航天、国防、能源、冶金、电子、工业、农业、交通、汽车、矿山、煤炭、纺织、信息、通信、IT、安防、环保、印刷、科研、气象、仪器仪表等领域从事科学的研究、产品设计、开发、生产制造的科技人员、管理人员 和采购人员提供满意服务。**我公司专业开发生产、代理、经销、销售各种传感器、变送器 敏感元器件、开关、执行器、仪器仪表、自动化控制系统：**专门从事设计、生产、销售各种传感器、变送器、各种测控仪表、热工仪表、现场控制器、计算机控制系统、数据采集系统、各类环境监控系统、专用控制系统应用软件以及嵌入式系统开发及应用等工作。如热敏电阻、压敏电阻、温度传感器、温度变送器、湿度传感器、湿度变送器、气体传感器、气体变送器、压力传感器、压力变送、称重传感器、物（液）位传感器、物（液）位变送器、流量传感器、流量变送器、电流（压）传感器、溶氧传感器、霍尔传感器、图像传感器、超声波传感器、位移传感器、速度传感器、加速度传感器、扭距传感器、红外传感器、紫外传感器、火焰传感器、激光传感器、振动传感器、轴角传感器、光电传感器、接近传感器、干簧管传感器、继电器传感器、微型电泵、磁敏（阻）传感器、压力开关、接近开关、光电开关、色标传感器、光纤传感器、齿轮测速传感器、时间继电器、计数器、计米器、温控仪、固态继电器、调压模块、电磁铁、电压表、电流表等特殊传感器。同时承接传感器应用电路、产品设计和自动化工程项目。
