#### 1 FUNCTION

The True Colour Sensors are made of 19 x 3 photo diodes (special PIN silicon technology with extended sensibility) integrated on chip. The diodes are carried out as segments of a multiple-element hexagonal matrix structure with the diameter of 2.0 mm.

The design as Si-PIN photo diodes allows signal frequencies up to MHzrange. In order to achieve a small cross talk between the photodiodes the individual sectors were separated from each other by additional structures.

Each of these photodiodes is sensitised with new dielectric spectral filter (named True Colour Filter<sup>1</sup>) for its colour range, preferably for the primary colour standard CIE (Commission Internationale de l'Eclairage or International Commission on Illumination) colour space.

#### **2 APPLICATION**

- Quality control
- Monitoring the production
- Control of manufacturing
- Detection of colour marks
- Colour measurement

#### **3 FEATURES**

Dielectric filters guaranties the good optical properties of the colour sensors, such as:

- high transmission
- slight ageing of the filter
- high temperature stability
- high signal frequency
- reduced cross talk
- small size (diameter of the optical sensitive surface ca. 2 mm)
- like tri-stimulus interference filter for colour measurement to DIN 5033 (&CIE XYZ & La\*b\*)
- **RoHS-conform**

DOC. NO: The information in this publication is believed to be accurate in all respects at the time of publication. MAZeT reserves the right to make changes in its products without notice DB-04-138e in order to improve design or performance characteristics.

Page 2 of 6

<sup>&</sup>lt;sup>1</sup> The new generation of JENCOLOUR sensors is committed to implementing (see relative sensitivity) the standard distribution functions as defined under DIN 5033 Part 2 - Color Measurement; CIE 1931 Standard Colorimetric Systems. This implementation method allows colors to be determined according to the three-range procedure that is defined in part 6 of DIN 5033.

#### 9 APPLICATION CIRCUIT

Opposite figure shows a circuit for the conversion of photo current to an equivalent voltage. These voltage can be processed e.g. with an ADC. By the selection of suitable resistors the output voltage range can be adjusted to the photo current value. (for example the pin-programmable transimpedance amplifier MTI04 with the resistors  $25k\Omega$ ,  $500k\Omega$  and  $5M\Omega$ )

$$R_x \approx \frac{V_{Out}}{I_{Photo}}$$
