HIGH FREQUENCY

Model G

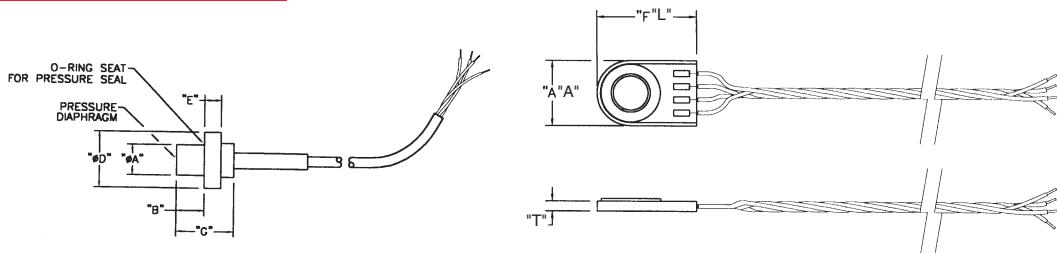

Model F

SENSOTEC products include a full line of subminiature pressure transducers to accurately measure pressure ranges from 10 psi to 20,000 psi. These subminiature pressure transducers have a high natural frequency and utilize a flush diaphragm. The specifications listed below are classified by high pressure ranges or low pressure ranges, and by foil gages (350 ohms) or semiconductor gages (500 ohms).

Temperature compensation is accomplished by using temperature sensitive components located inside the transducers. These transducers have a small electrical zero balance circuit board which is in the lead wire (approximately 1" X .087" thick). This balance board does not have to be the same temperature as the transducer. The application should dictate the type of strain gage utilized. Generally, the semiconductors are used when high output (30 mv/v) is required; and foil strain gages are used when longer term very high stability and excellent thermal characteristics are required. All units have four (4) active bonded strain gages arranged in a Wheatstone bridge configuration.

Most SENSOTEC subminiature transducers are manufactured with a unitized stainless steel diaphragm. The advantage of this type of design is that a thin diaphragm and heavy sidewalls are made from one piece of stainless steel. This unitized diaphragm is rugged, but at the same time it is thin enough to measure low pressures.
