TGS 2612 - for the detection of Methane and LP Gas

Features:

- * Low power consumption
- * Similar sensitivity at same %LEL levels for both methane and LP gas
- * Long life and low cost
- * Uses simple electrical circuit

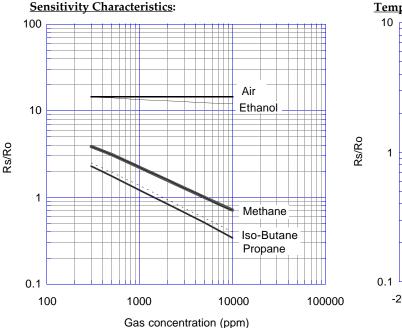

The sensing element is comprised of a metal oxide semiconductor layer formed on an alumina substrate of a sensing chip together with an integrated heater. In the presence of a detectable gas, the sensor's conductivity increases depending on the gas concentration in the air. A simple electrical circuit can convert the change in conductivity to an output signal which corresponds to the gas concentration.

The **TGS 2612** has high sensitivity to methane, propane and butane, making it ideal for LNG and LPG monitoring. Due to its low sensitivity to alcohol vapors (a typical interference gas in the residential environment), the sensor is ideal for consumer market gas alarms.

The figure below represents typical sensitivity characteristics, all data having been gathered at standard test conditions (see reverse side of this sheet). The Y-axis is indicated as *sensor resistance ratio* (Rs/Ro) which is defined as follows:

- Rs = Sensor resistance in displayed gases at various concentrations
- Ro = Sensor resistance in 5000ppm of methane

Applications:

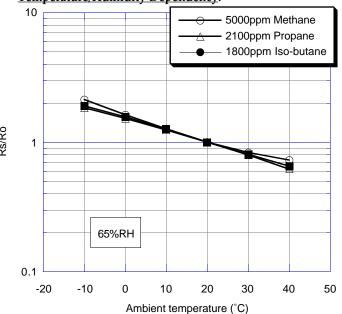

- * Residential LNG and LPG alarms
- * Portable combustible gas leak detectors
- * Detectors for LNG and LPG

The figure below represents typical temperature and humidity dependency characteristics. Again, the Y-axis is indicated as *sensor resistance ratio* (Rs/Ro), defined as follows:

Rs = Sensor resistance at 10%LEL of each gas at various temperatures/65%RH Ro = Sensor resistance at 10%LEL of each gas at 20°C and 65% R.H.

Temperature/Humidity Dependency:

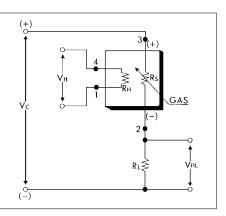

IMPORTANT NOTE: OPERATING CONDITIONS IN WHICH FIGARO SENSORS ARE USED WILL VARY WITH EACH CUSTOMER'S SPECIFIC APPLICATIONS. FIGARO STRONGLY RECOMMENDS CONSULTING OUR TECHNICAL STAFF BEFORE DEPLOYING FIGARO SENSORS IN YOUR APPLICATION AND, IN PARTICULAR, WHEN CUSTOMER'S TARGET GASES ARE NOT LISTED HEREIN. FIGARO CANNOT ASSUME ANY RESPONSIBILITY FOR ANY USE OF ITS SENSORS IN A PRODUCT OR APPLICATION FOR WHICH SENSOR HAS NOT BEEN SPECIFICALLY TESTED BY FIGARO.

Basic Measuring Circuit:

The sensor requires two voltage inputs: heater voltage (V_H) and circuit voltage (V_C). The heater voltage (V_H) is applied to the integrated heater in order to maintain the sensing element at a specific temperature which is optimal for sensing. Circuit voltage (V_C) is applied to allow measurement of voltage (V_{RL}) across a load resistor (R_L) which is connected in series with the sensor.

A common power supply circuit can be used for both Vc and V_H to fulfill the sensor's electrical requirements. The value of the load resistor (R_L) should be chosen to optimize the alarm threshold value, keeping power dissipation (Ps) of the semiconductor below a limit of 15mW. Power dissipation (Ps) will be highest when the value of Rs is equal to R_L on exposure to gas.

Specifications (tentative):

|--|

Model number			TGS 2612	
Sensing element type			D1	
Standard package			TO-5 metal can	
Target gases			Methane, propane, iso-butane	
Typical detection range			1~25%LEL of each gas	
Standard circuit conditions	Heater Voltage	Vн	5.0±0.2V DC/AC	
	Circuit voltage	Vc	5.0±0.2V DC/AC	Ps ≤ 15mW
	Load resistance	R∟	Variable	0.45k Ω min.
Electrical characteristics under standard test conditions	Heater resistance	Rн	approx. 59 Ω at room temp.	
	Heater current	Ін	56 ± 5 mA	
	Heater power consumption	Рн	280mW	VH = 5.0V DC
	Sensor resistance	Rs	$0.68 \sim 6.8 \mathrm{k}\Omega$ in 5000ppm methane	
	Sensitivity (change ratio of Rs)		0.50 ~ 0.65	<u>Rs (9000ppm)</u> Rs (3000ppm)
	Cross sensitivity (corresponding with 10%LEL methane)		≤25%LEL propane ≤25%LEL iso-butane	
Standard test conditions	Test gas conditions		Methane, propane, & iso-butane in air at 20±2°C, 65±5%RH	
	Circuit conditions		Vc = 5.0±0.01V DC Vн = 5.0±0.05V DC	
	Conditioning period before test		7 days	

The value of power dissipation (Ps) can be calculated by utilizing the following formula:

$$\mathsf{Ps} = \frac{(\mathsf{Vc} - \mathsf{V}_{\mathsf{RL}})^2}{\mathsf{Rs}}$$

Sensor resistance (Rs) is calculated with a measured value of V_{RL} by using the following formula:

$$Rs = \frac{V_{C} - V_{RL}}{V_{RL}} \times R_{L}$$
